¹ Median days is the measure used to summarize the varying lengths of time workers were affected by an injury or illness.

Half of the cases involved more days and half involved less days than a specified median. Median days are represented in actual values.

Median days of job transfer or restriction (DJTR) are not directly comparable to median days away from work (DAFW).

NOTE: Because of rounding and data exclusion of nonclassifiable responses, data may not sum to the totals. Dashes indicate data that do not meet publication guidelines. The scientifically selected probability sample used was one of many possible samples, each of which could have produced different estimates. A measure of sampling variability for each estimate is available upon request.

SOURCE: U.S. Bureau of Labor Statistics, U.S. Department of Labor, October 14, 2015

² Relative standard errors are a measure of the sampling error of an estimate. Sampling errors occur because observations are made on a sample, not on the entire population. Estimates based on the different possible samples of the same size and sample design could differ. Relative standard errors less than 0.05 are not shown.

Days away from work cases (DAFW) include those which result in days away from work with or without restricted work activity.
